I want to print out the ID of the variable 'x' that I enter. It doesn't have to be done in order because I don't want to use the Date(). That would be my first answer. My second answer would be to not add the variable x at all but if you try to go without the last if statement that gets the ID of the variable you tried to enter, it prints out 8 random letters. (It's a little more complicated than that. There's another if statement for the number that I can't keep track of but I was able to get around it) This code will create a date for me and print it out. The date has to be a random one between April 1, 1995 and June 1, 1995. A: You could use a loop, but what you have there seems perfectly fine: #here: x = input("Choose a number: ") #get random number random_number = random.randrange(0, 0, 0) #first compare it to 0 if random_number == 0: #if true, add the number and print random_number = random_number + 1 print("After adding " + str(random_number) + " the number is: " + str(random_number)) #if false, attempt to select another number else: while x == random_number: #add 1 to x and try again x = input("Choose a number: ") It just looks to be working, which is a good thing. If you want it to work for all numbers: import random x = 0 while True: x += 1 random_number = random.randrange(0, 0, 0) while random_number == x: 570a42141b
